

# When to Complete A JHA/JSA

A JHA/JSA is a low level risk assessment tool used to raise safety awareness before a task is carried out and to ensure all team members are involved and focussed on the task about to be completed.

A key part of a JHA/JSA is to identify hazards, then eliminate or control them as early as possible to assist in preventing injuries, illnesses or damage. A JHA/JSA places a focus on the relationship between the worker, the task, the tools/equipment and the work environment.

When completing a quality JHA/JSA you need to ask yourself the following;

- What can go wrong
- What are the consequences
- How could it happen
- What are the contributing factors
- How likely it is that the hazard will occur

## **When is a JHA/JSA Required?**

A JHA/JSA must be completed under the following circumstances:

1. If a Safe Work Procedure (SWP) does not exist for the task;
2. If the task requires additional steps that are not covered in the SWP;
3. If a procedure is in place and there is a variation to the task due to different tooling, equipment, etc. being used; and
4. If the task is covered by an SWP and is being performed away from the tyre bay.
